Manuscript received April 27, 1990; in final form March 08, 1991

Abstract

Spatial distributions of biogenic salts (nitrates, nitrites, phosphates and oxygen) at selected depths (0, 50, 100 and 200 m) and along certain profiles are presented in the article. The analyses were based on the results of measurements conducted during the NOSEX-86 cruise. Spatial variability of nutrients in the region of observations together with indications of the causes are also discussed.
